A large class of new bivariate copulas and their properties

Zahra Sharifonnasabi, Mohammad Hossein Alamatsaz 1 and Iraj Kazemi

Department of Statistics, University of Isfahan, Isfahan, Iran

Abstract. In this paper, we shall construct a large class of new bivariate copulas. This class happens to contain several known classes of copulas, such as Farlie-Gumbel-Morgenstern, Ali-Mikhail-Haq and Barnett-Gumbel, as its especial members. It is shown that the proposed copulas improve the range of values of correlation coefficient and thus they are more applicable in data modeling. We shall also reveal that the dependent properties of the base copula are preserved by the generated copula under certain conditions. Several members of the new class are introduced as instances and their range of correlation coefficients are computed.

1 Introduction

Copulas are useful tools in constructing joint distributions. In fact, a copula is a multidimensional distribution function (d.f.) whose marginals are uniformly distributed on $[0, 1]$. We shall only focus on bivariate copulas and their properties in this manuscript.

A bivariate copula is a function $C : I^2 \rightarrow I(= [0, 1])$ which satisfies the boundary conditions

$$C(t, 0) = C(0, t) = 0 \quad \& \quad C(t, 1) = C(1, t) = t, \quad t \in I$$ (1.1)

and the 2-increasing condition

$$C(u_2, v_2) - C(u_1, v_2) - C(u_2, v_1) + C(u_1, v_1) \geq 0$$ (1.2)

for all $u_1, u_2, v_1, v_2$ in $[0, 1]$ such that $u_1 \leq u_2$ and $v_1 \leq v_2$.

According to Sklar$^\dagger$'s Theorem (see Sklar (1959)), using a two-dimensional copula $C(., .)$, any bivariate d.f. $H_{X,Y}$ can be represented as a function of

---

1Mohammad Hossein Alamatsaz

Keywords and phrases. FGM copulas, Stochastic Dependence, Tail Dependence, Spearman's $\rho$

---
its marginal distributions $F_X$ and $F_Y$. In fact, if $F_X$ and $F_Y$ are continuous d.f.’s, then there exists a unique copula such that

$$H_{X,Y}(x, y) = C(F_X(x), F_Y(y))$$

where

$$C(u, v) = P(U \leq u, V \leq v), \quad U \equiv F_X(x), \quad V \equiv F_Y(y).$$

Assuming that $C$ is differentiable with respect to its both arguments, Equation (1.2) is satisfied if

$$c(u, v) = \frac{\partial^2 C(u, v)}{\partial u \partial v} \geq 0.$$  

Furthermore, it is known that

$$\frac{\partial C(u, v)}{\partial u} = P(V \leq v \mid U = u) \geq 0, \quad \frac{\partial C(u, v)}{\partial v} = P(U \leq u \mid V = v) \geq 0.$$  

For further details about copulas, see Nelsen (2006).

A known and useful family of copulas is $FGM$ family. This family is used, e.g., for competing risk problems Tolley and Norman (1979), the joint occurrence of certain trace elements in water Cook and Johnson (1986) and a robustness issue Delahorra and Fernandez (1995). However, a shortcoming of $FGM$ copulas is that they do not allow modeling of high dependencies because their spearman’s $\rho$ is limited to $[\frac{-1}{3}, \frac{1}{3}]$. To overcome this problem, many authors such as Huang and Kotz (1999), Bairamov and Kotz (2002), Amblard and Girard (2002, 2009), Amini et al. (2011) have tried to extend this family. Recently Klein and Christa (2011) proposed a class of copulas which contains $FGM$ copulas as follows: A bivariate function

$$C(u, v; \gamma) = uv[1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma}} \quad \forall u, v \in I$$

is a copula if the function $\phi : [0, 1] \rightarrow \mathbb{R}$ is a differentiable and monotone function satisfying

1. $\phi(1) = 0,$
2. $|\phi(u)| \leq 1, u \in [0, 1]$ 
3. $D = \{\gamma \neq 0: \mid \phi(u) + u\phi'(u) \mid \leq 1, u \in [0, 1]\},$
4. either $\gamma \in D$ and $\theta \in [-1, 1]$ such that $\theta \gamma > 0$, or $\phi$ is non-negative and monotonely decreasing or non-positive and monotonely increasing on $u \in [0, 1]$ and

$$\gamma \in D \cap (0, 1) \quad \& \quad \theta \in [-1, 0]$$
A large class of new bivariate copulas and their properties

3

or

\[ \gamma \in D \cap (-\infty, -1) \quad \& \quad \theta \in (0, 1]. \]

Also, the bivariate function

\[ C(u, v; \theta) = uv e^{\theta \phi(u) \phi(v)} u, v \in I \]  \hspace{1cm} (1.8)

is a copula for \( \theta \in [0, 1] \) if

1. \( \phi(1) = 0 \),
2. \( |\phi(u)| \leq 1, u \in [0, 1], \)

where \( \phi : [0, 1] \to \mathbb{R} \) is a differentiable and monotone function, and it is a copula for \( \theta \in [-1, 0] \) if

1. \( \phi(1) = 0 \),
2. \( |u \phi'(u)| \leq 1, u \in [0, 1], \)

where \( \phi : [0, 1] \to \mathbb{R} \) is differentiable, non-negative and monotonely decreasing or non-positive and monotonely increasing on \([0, 1]\).

The remainder of the paper is organized as follows. In Section 2, replacing the independent copula \( uv \) in (1.7) and (1.8) by a general copula \( K(u, v) \), we shall introduce a new class of copulas which extends several known classes of copulas, such as FGM, AMH and BG and several other families. We shall discuss conditions under which our generalization is justified. Several illustrating examples are provided in Section 3. Dependent properties of the new class are studied in Section 4. In Section 5, we shall discuss tail dependencies of members of this new family. Measures of association are discussed in Section 6, where it is observed that the new family can be used to model data with a wider range of correlation than the FGM family.

2 A New Class of Bivariate Copulas

Consider the bivariate copula (1.7) and (1.8) of Klein and Christa (2011). We replace the coefficient \( uv \), the independent copula, by an arbitrary copula \( K(u, v) \). That is, we consider the bivariate function

\[ C(u, v; \theta, \gamma) = K(u, v)[1 + \theta \phi(u) \phi(v)]^{\frac{1}{\gamma}} \quad \forall u, v \in I, \]  \hspace{1cm} (2.1)

where \( \theta \in [-1, 1] \) and \( \gamma \in \mathbb{R}/\{0\} \) and

\[ C(u, v; \theta) = K(u, v)e^{\theta \phi(u) \phi(v)} \quad \forall u, v \in I, \]  \hspace{1cm} (2.2)

where \( \theta \in [-1, 1] \).
The next theorems provide certain conditions under which $C(u, v; \gamma, \theta)$ and $C(u, v; \theta)$ in (2.1) and (2.2), respectively, are indeed well defined copulas. First, in order to simplify the statements of our theorems, we set up the following assumptions and definitions:

Assumptions :

1. $\frac{\partial^2}{\partial u^2} \ln K(u, v) \geq 0, \ \forall (u, v) \in I^2$.
2. $G = \{ \gamma \neq 0; | \phi(u) + \frac{\phi'(u)}{\gamma \ln K(u, v)}| \leq 1, | \phi(v) + \frac{\phi'(v)}{\gamma \ln K(u, v)}| \leq 1, (u, v) \in I^2 \}$.
3. $0 \leq \phi(u) \leq 1$ and be decreasing or $-1 \leq \phi(u) \leq 0$ and be increasing.
4. $\phi(u)$ is a negative and non-decreasing function and $\phi'(u) \leq \frac{\partial}{\partial u} \ln K(u, v), \forall v \in I$.
5. $| \phi'(u) | \leq 1$ and $\frac{k(u, v)}{K(u, v)} \geq 1$ or $\frac{k(u, v)}{K(u, v)} \geq \phi'(u) \phi'(v)$ for $u, v \in [0, 1]$, where $k(u, v) = \frac{\partial^2}{\partial u \partial v} K(u, v)$.

Definitions:

$Q_0 = \{ \gamma \neq 0; \frac{k(u, v)}{K(u, v)} \geq \frac{\phi'(u) \phi'(v)}{\gamma^2 [1 - \phi(u) \phi(v)]}, (u, v) \in I^2 \}$,

$Q_1 = \{ \gamma \neq 0; \phi(u) + A(u, v, \gamma) \geq 0, \phi(v) + B(u, v, \gamma) \geq 0, (u, v) \in I^2 \}$,

$Q_2 = \{ \gamma \neq 0; | \frac{\phi'(u)}{\sqrt{\gamma^2 [\frac{\partial}{\partial u} \ln K(u, v)]}} | \leq 1, | \frac{\phi'(v)}{\sqrt{\gamma^2 [\frac{\partial}{\partial v} \ln K(u, v)}] | \leq 1, (u, v) \in I^2 \}$.

where $A(u, v, \gamma) = \frac{\phi'(u)}{\gamma \frac{\partial}{\partial u} \ln K(u, v)}, B(u, v, \gamma) = \frac{\phi'(v)}{\gamma \frac{\partial}{\partial v} \ln K(u, v)}$.

Theorem 2.1. Let $\phi: [0, 1] \rightarrow [-1, 1]$ be a monotone and differentiable function with $\phi(1) = 0$ and $K(u, v)$ be differentiable with respect to its both arguments $u$ and $v$. Then, $C(u, v; \theta, \gamma) = K(u, v)[1 + \theta \phi(u) \phi(v)]^{\frac{1}{2}}$ is a copula

(i) under Assumptions 1 and 2 for $\theta \in [-1, 1]$ provided that $\theta \gamma > 0$.

(ii) under Assumption 3 for $\gamma \in (0, 1] \cap Q_0$ or $\gamma \in (0, 1] \cap Q_1$ and $-1 \leq \theta \leq 0$.

(iii) under Assumption 1 and 3 and $K(u, v) = K(v, u)$ for all $u, v \in I^2$, for $\gamma \in (-\infty, -1] \cap Q_2, 0 \leq \theta \leq 1$. 

imsart-bjps ver. 2014/10/16 file: paper.tex date: October 21, 2016
Proof. Obviously boundary conditions are satisfied. Thus, it is sufficient to prove that under the mentioned conditions $C(u, v; \theta, \gamma)$ is 2-increasing. Let
c(u, v; \theta, \gamma) = \frac{\partial^2}{\partial u \partial v} C(u, v; \theta, \gamma).$
Hence we have
\[
c(u, v; \theta, \gamma) = \frac{\partial^2}{\partial u \partial v} \ln C(u, v; \theta, \gamma) + \frac{\partial}{\partial u} \ln C(u, v; \theta, \gamma) \frac{\partial}{\partial v} \ln C(u, v; \theta, \gamma).
\]
(2.3)

(i) Clearly, since $K(u, v)$ is differentiable, under Assumption 2 we obtain
\[
\frac{\partial}{\partial u} \ln C(u, v; \theta, \gamma) = \frac{\partial}{\partial u} \ln K(u, v) \frac{\frac{\partial}{\partial u} \ln K(u, v)}{1 + \theta \phi(u) \phi(v)} \{1 + \theta \phi(v) \frac{\partial}{\partial u} \ln K(u, v) + \frac{\phi(u)}{\gamma} \frac{\partial}{\partial u} \ln K(u, v)\}
\]
and
\[
\frac{\partial}{\partial v} \ln C(u, v; \theta, \gamma) = \frac{\partial}{\partial v} \ln K(u, v) \frac{\frac{\partial}{\partial v} \ln K(u, v)}{1 + \theta \phi(u) \phi(v)} \{1 + \theta \phi(v) \frac{\partial}{\partial v} \ln K(u, v) + \frac{\phi(v)}{\gamma} \frac{\partial}{\partial v} \ln K(u, v)\}
\]
are non-negative. Moreover, by Assumption 1,
\[
\frac{\partial^2}{\partial u \partial v} \ln C(u, v; \theta, \gamma) = \frac{\partial^2}{\partial u \partial v} \ln K(u, v) + \frac{\phi(u) \phi(v)}{[1 + \theta \phi(u) \phi(v)]^2}
\]
is non-negative. Therefore, by (2.3), $c(u, v) \geq 0$ and, thus, by (1.5) the 2-increasing property holds.

(ii) We prove the case when $\phi(u)$ is non-negative and decreasing, the other case follows by replacing $\phi(u)$ with $-\phi(u)$ in the copula function. According to (2.3)
\[
c(u, v; \theta, \gamma) = \frac{\partial^2}{\partial u \partial v} \ln K(u, v) + \frac{\phi(u) \phi(v)}{[1 + \theta \phi(u) \phi(v)]^2} \{\frac{\partial}{\partial u} \ln K(u, v) + \frac{\phi(u) \phi(v)}{[1 + \theta \phi(u) \phi(v)]} \}
\]
\[
\times \frac{\theta \phi(u) \phi(v)}{[1 + \theta \phi(u) \phi(v)]} \{\phi(v) + \frac{\phi'(v) [1 + \theta \phi(u) \phi(v)]}{[1 + \theta \phi(u) \phi(v)]} \frac{\partial}{\partial v} \ln K(u, v)\},
\]
(2.4)
where $k(u, v) = \frac{\partial^2}{\partial u \partial v} K(u, v)$. If $0 < \gamma \leq 1$, then
\[
\frac{1 + \frac{\theta \phi(u) \phi(v)}{\gamma}}{1 + \theta \phi(u) \phi(v)} = \frac{1 + \theta \phi(u) \phi(v)}{\gamma} \leq \frac{1}{\gamma}
\]
and since $\phi'(u) \leq 0$ and $\theta \leq 0$, we have

$$\theta \phi'(u)\{\phi(v) + \frac{\phi'(v)}{2}\phi(u)\phi(v) - \frac{\phi'(u)}{2}\phi(v)\} \geq \theta \phi'(u)\{\phi(v) + B(u, v, \gamma)\}.$$ 

Consequently, if $\gamma \in (0, 1] \cap Q_1$

$$\frac{c(u, v; \theta, \gamma)}{C(u, v; \theta, \gamma)} \geq \frac{k(u, v)}{K(u, v)} + \frac{\theta}{\gamma} \frac{\phi(u)\phi'(v)}{1 + \theta\phi(u)\phi(v)} \frac{\partial}{\partial u} \ln K(u, v)$$

$$+ \frac{\partial}{\partial v} \ln K(u, v) \frac{\theta}{\gamma} [1 + \theta\phi(u)\phi(v)] \{\phi(v) + B(u, v, \gamma)\} \geq 0,$$

and if $\gamma \in (0, 1] \cap Q_0$ we can rewrite

$$\frac{c(u, v; \theta, \gamma)}{C(u, v; \theta, \gamma)} \geq \frac{k(u, v)}{K(u, v)} + \frac{\theta}{\gamma} \frac{\phi(u)\phi'(v)}{1 + \theta\phi(u)\phi(v)} \frac{\partial}{\partial u} \ln K(u, v)$$

$$+ \frac{\partial}{\partial v} \ln K(u, v) \frac{\theta}{\gamma} [1 + \theta\phi(u)\phi(v)] \{\phi(v) + B(u, v, \gamma)\} \geq 0,$$

because

$$\frac{\theta \phi'(u)\phi'(v)}{\gamma^2 [1 + \theta\phi(u)\phi(v)]} \geq \frac{-\phi'(u)\phi'(v)}{\gamma^2 [1 - \phi(u)\phi(v)].}$$

(iii) Similar to part (b), we just prove the case when $\phi(u)$ is non-negative and decreasing. Since $\gamma \in (-\infty, -1) \cap Q_2$, it follows that $\phi(u) + \frac{\phi'(u)}{\gamma \phi(u)} \geq 0$. Thus, we have

$$\frac{c(u, v; \theta, \gamma)}{C(u, v; \theta, \gamma)} = \frac{\partial^2}{\partial u \partial v} \ln K(u, v) + \frac{\theta}{\gamma} \frac{\phi'(u)\phi'(v)}{1 + \theta\phi(u)\phi(v)}$$

$$+ \frac{\partial}{\partial u} \ln K(u, v) \frac{\theta}{\gamma} [1 + \theta\phi(u)\phi(v)] \{\phi(v) + B(u, v, \gamma)\}$$

$$\times \frac{\partial}{\partial v} \ln K(u, v) \frac{\theta}{\gamma} [1 + \theta\phi(u)\phi(v)]$$

$$\frac{\partial^2}{\partial u \partial v} \ln K(u, v) + \frac{\theta}{\gamma} \frac{\phi'(u)\phi'(v)}{1 + \theta\phi(u)\phi(v)}$$

$$+ \frac{\partial}{\partial u} \ln K(u, v) \frac{\theta}{\gamma} [1 + \theta\phi(u)\phi(v)]$$

$$\times \frac{\phi'(u)}{\sqrt{\gamma} \frac{\partial}{\partial u} \ln K(u, v)} \frac{\phi'(v)}{\sqrt{\gamma} \frac{\partial}{\partial v} \ln K(u, v)} \{1 - \theta\} \geq 0.$$

This completes the proof. \(\square\)
Theorem 2.2. Let \( \phi \) be a differentiable function and \( \phi(1) = 0 \). Then, 
\[ C(u, v; \theta) = K(u, v)e^{\theta \phi(u)\phi(v)} \] is a copula
(i) for \( \theta \in [0, 1] \) under Assumptions 1 and 4.
(ii) for \( \theta \in [-1, 0] \) under Assumptions 3 and 5.

Proof. (i) Obviously boundary conditions are satisfied. As before, it is sufficient to show that 
\[ c(u, v) \geq 0. \] According to Assumption 4, we have
\[ \frac{\partial^2}{\partial u \partial v} \ln C(u, v; \theta) = \frac{\partial^2}{\partial u \partial v} \ln K(u, v) + \theta \phi'(u)\phi'(v) \geq 0. \] (2.5)
and since \( \theta \phi(v) \leq 0 \) we obtain
\[ \theta \phi'(u)\phi(v) \geq \theta \phi(v) \frac{\partial}{\partial u} \ln K(u, v). \]
Thus
\[ \frac{\partial}{\partial u} \ln C(u, v; \theta) \geq \frac{\partial}{\partial u} \ln K(u, v)[1 + \theta \phi(v)] \geq 0, \]
and thus, (2.3) is non-negative. Hence the result follows.
(ii) Again, we have
\[
C(u, v; \theta) = \frac{k(u, v)}{K(u, v)} - \frac{\partial}{\partial u} \ln K(u, v) \frac{\partial}{\partial v} \ln K(u, v) + \theta \phi'(u)\phi'(v)
+ \frac{\partial}{\partial u} \ln K(u, v) \frac{\partial}{\partial v} \ln K(u, v)[1 + \theta \frac{\phi'(u)\phi(v)}{\partial u}]
\times [1 + \theta \frac{\phi(u)\phi'(v)}{\partial v} \ln K(u, v)].
\]
Since \( \theta \in [-1, 0] \), by the properties of \( \phi(u) \), we obtain
\[ \frac{c(u, v; \theta)}{C(u, v; \theta)} \geq \frac{k(u, v)}{K(u, v)} + \theta \phi'(u)\phi'(v) \geq 0. \]
i.e., \( c(u, v) \geq 0. \) \( \square \)

3 Some Examples

In this section, we introduce several members of our class of copulas. First we need to recall some copulas \( K(u, v) \) in Table 1 which are used in the sequel.
Table 1  Some bivariate copulas recalled.

Example 3.1. Based on Theorem 2.1 (i) the bivariate function

$$C(u, v; \theta, \gamma, \delta, k) = uv[1 + \delta(1 - u)^{2}(1-v)^{2}]\left[1 + \theta(1 - u^k)(1 - v^k)\right]^\frac{1}{2},$$  

(3.1)

is a copula for $u, v \in I$ when

(a) $0 \leq \theta \leq 1$, $0 \leq \delta \leq 1$, $0 \leq k \leq 1$, $\gamma \geq 1$

or

(b) $0 \leq \theta \leq 1$, $0 \leq \delta \leq 2$, $1 \leq k \leq 3$, $\gamma \geq 3$

and for $-1 \leq \theta \leq 0$, $0 \leq \delta \leq 1$ when

(c) $0 \leq k \leq 1$, $\gamma \leq -2$

or

(d) $1 \leq k \leq 2$, $\gamma \leq -4$,

or

(e) $2 \leq k \leq 3$, $\gamma \leq -6$.

Here, $\phi_{0}(u) = 1 - u^k$, for which boundary condition of Theorem 2.1 holds. Moreover, by using Table 1

$$K(u, v; \delta) = uv[1 + \delta(1-u)^{2}(1-v)^{2}], \quad \delta \in [-1, 3],$$
Example 3.2. Based on Theorem 2.1 (i) the bivariate function

\[ C(u, v; \theta, \gamma, \alpha, k) = uv[\theta(1-u^k)(1-v^k)]^\gamma [1 + \alpha(u^2 - 1)(v^2 - 1)][1 + \theta(1-u^k)(1-v^k)]^{1/\gamma}. \] (3.2)
is a copula for

\[-1 \leq \theta \leq 0, \quad 0 \leq \alpha \leq 0.4, \quad \gamma \leq -5k, \quad k > 0,\]

or

\[0 \leq \theta \leq 1, \quad 0 \leq \alpha \leq 0.4, \quad \gamma \geq 5k, \quad k > 0.\]

First we note that

\[K(u, v; \alpha) = uv[1 + \alpha(u^2 - 1)(v^2 - 1)],\]

is a copula for \(\alpha \in [-0.25, 1]\) and

\[\frac{\partial^2}{\partial v \partial u} \ln K(u, v; \alpha) = \frac{4\alpha uv}{[1 + \alpha(u^2 - 1)(v^2 - 1)]^2} \geq 0, \quad \alpha \in [0, 1].\]

Now, we define

\[r(u, v; \alpha, \gamma, k) = \phi(u) + \frac{\phi'(u)}{\gamma \frac{\partial}{\partial u} \ln K(u, v; \alpha)} = 1 - \frac{k}{\gamma} R(u, v; \alpha)\]

where

\[R(u, v; \alpha) = \frac{1 + \alpha(u^2 - 1)(v^2 - 1)}{1 + \alpha(u^2 - 1)(v^2 - 1) + 2\alpha uv^2(v^2 - 1)}.\]
We note that it is sufficient to investigate the range of \( r(u, v; \alpha, \gamma, k) \) at \( \gamma = -5k \) and \( \gamma = 5k \). Moreover, we can easily show that the function \( R(u, v; \alpha) \) is a decreasing function in \( v \) and increasing function in \( \alpha \) and \( u \), so \( 1 \leq R(u, v; \alpha) \leq 5 \). Hence,

\[
0 \leq u^k \{ 1 - \frac{1}{5} R(u, v; \alpha) \} \leq 1, u, v \in [0, 1] \Rightarrow 0 \leq r(u, v; \alpha, \gamma, k) \leq 1
\]

\[
0 \leq u^k \{ 1 + \frac{1}{5} R(u, v; \alpha) \} \leq 2, u, v \in [0, 1] \Rightarrow -1 \leq r(u, v; \alpha, \gamma, k) \leq 1.
\]

for \( \alpha \in [0, 0.4] \). Figure 2 illustrates our claim for certain values of the parameters.

It is also worth noting that, similarly, the bivariate function

\[
C(u, v; \delta, \theta, \gamma, p) = uv[1 + \delta(1 - u^p)(1 - v^p)][1 + \theta(1 - u)(1 - v)]^{\frac{1}{2}}, \quad (3.3)
\]

is a copula for \( p > 0 \), \( 0 \leq \delta \leq \frac{1}{2p} \), \( \gamma \geq 2 \) and \( 0 \leq \theta \leq 1 \) or \( \gamma \leq -2 \) and \(-1 \leq \theta \leq 0 \). Also, the bivariate function

\[
C(u, v; \alpha, \beta, \gamma, \theta) = uv[1 + \alpha(1 - u)(1 - v) + \beta(1 - u)^2(1 - v)^2]
\times
[1 + \theta(e^{-u} - e^{-1})(e^{-v} - e^{-1})]^{\frac{1}{2}}, \quad (3.4)
\]

is also a copula for \( 0 \leq \beta \leq 1 \), \( 0 \leq \alpha < 1 \), \(-1 \leq \theta \leq 0 \) and \( \gamma \leq -\frac{2}{e(1 - \alpha)} \) or \( 0 \leq \theta \leq 1 \) and \( \gamma \geq \frac{2}{e(1 - \alpha)} \) and the bivariate function

\[
C(u, v; \alpha, \beta, \theta, \gamma, k) = uv[1 + \alpha(1 - u)(1 - v) + \beta(1 - u)^2(1 - v)^2]
\times
[1 + \theta(1 - u)(1 - v)]^{\frac{1}{2}}, \quad (3.5)
\]

is a copula for \( 0 \leq \alpha < 1 \), \( 0 \leq \beta \leq 1 \), \(-1 \leq \theta \leq 0 \), \( \gamma \leq -\frac{2}{1 - \alpha} \) or \( 0 \leq \theta \leq 1 \), \( \gamma \geq \frac{2}{1 - \alpha} \).
Example 3.3. The bivariate function

\[ C(u, v; \theta, \delta, \gamma) = uv[1 + \delta(1-u)^2(1-v)^2][1 + \theta(1-u)(1-v)]^{\frac{1}{2}}, \]  

is a copula for \( u, v \in I, \ 0 \leq \theta \leq 1, \ 0 \leq \delta \leq 1.5 \) and \( \gamma \leq -3 \) because it satisfies the conditions of Theorem 2.1 (ii).

Clearly, since \( \phi(u) = 1 - u \), boundary condition and Assumption 3 hold. Furthermore, similar to Example 3.1, we have

\[ \frac{\partial^2}{\partial v \partial u} \ln K(u, v; \theta, \delta, \gamma) \geq 0, \quad \delta \in [0, 1.5]. \]

Now, we define

\[ t(u, v; \delta, \gamma) = \frac{-\phi'(u)}{\sqrt{|\gamma|} \frac{\partial}{\partial u} \ln K(u, v)} = \frac{u[1 + \delta(1-u)^2(1-v)^2]}{\sqrt{|\gamma|}[1 + \delta(1-u)^2(1-v)^2 - 2\delta u(1-u)(1-v)^2]}, \]

which is obviously non-negative. Thus, it is sufficient to show that \( t(u, v; \delta, \gamma) \leq 1 \). Obviously \( t(u, v; \delta, \gamma) \) is a decreasing function in \( v \) and \( \gamma \). So, we need to investigate the values of \( t(u, 0; \delta, -3) \). As Figure 3 illustrates we can show that \( t(u, 0; \delta, -3) \leq 1 \) for \( 0 \leq u \leq 1 \) and \( 0 \leq \delta \leq 1.5 \).

![Figure 3 Illustrations of \( t(u, 0; \delta, -3) \).](image)

Example 3.4. The bivariate function

\[ C(u, v; \theta, \alpha) = uv[1 + \alpha(1-u)(1-v)(1+uv)]e^{\theta(e^{-1} - e^{-v})(e^{-1} - e^{-v})}, \]  

(3.7)
is a copula for $0 \leq \theta \leq 1$ and $0 \leq \alpha \leq 1 - e^{-1}$, because it satisfies the conditions of Theorem 2.2 (i). Clearly, since $\phi(u) = e^{-1} - e^{-u}$, the boundary condition holds. Furthermore, by using Table 1, we have that

$$K(u, v; \alpha) = uv[1 + \alpha(1-u)(1-v)(1+uv)],$$

is a copula for $0 \leq \alpha \leq 1$ and

$$\frac{\partial^2}{\partial v \partial u} \ln K(u, v; \alpha) = \frac{\alpha[1 + \alpha(1-u)^2(1-v)^2 + (1-2u)(1-2v)]}{[1 + \alpha(1-u)(1-v)(1+uv)]^2} \geq 0,$$

for $\alpha \in [0,1]$, because $(1-2u)(1-2v) \geq -1$. Now, we define

$$q(u, v; \alpha) = \frac{\partial}{\partial u} \ln K(u, v; \alpha) - \phi'(u)$$
$$= \frac{1}{u} + \frac{\alpha(1-v)(v-2uv-1)}{1 + \alpha(1-u)(1-v)(1+uv)} - e^{-u}$$
$$= g(u) + f_1(u, v; \alpha),$$

where, obviously

$$g(u) = \frac{1}{u} - e^{-u} \geq 0, \quad f_1(u, v; \alpha) = \frac{\alpha(1-v)(v-2uv-1)}{1 + \alpha(1-u)(1-v)(1+uv)} \leq 0.$$

Both functions $g$ and $f_1$ are decreasing in $u$, because

$$g'(u) = e^{-u} - \frac{1}{u^2} \leq e^{-u} - 1 \leq 0,$$
$$\frac{\partial}{\partial u} f_1(u, v; \alpha) = \frac{1}{[1 + \alpha(1-u)(1-v)(1+uv)]^2} \left[ - \alpha^2(1-v)^2(v-2uv-1)^2 - 2\alpha(1-v)(1 + \alpha(1-u)(1-v)(1+uv)) \right] \leq 0.$$

g decreases very faster than $f_1$, so to find values $\alpha$ such that $q(u, v; \alpha) \geq 0$ for $u, v \in [0,1]$, it is sufficient to investigate the sign of $q(1, v; \alpha)$ for $v \in [0,1]$. But, clearly, we have

$$q(1, v; \alpha) = 1 - e^{-1} - \alpha(1-v^2) \geq 0, \quad 0 \leq \alpha \leq 1 - e^{-1}.$$

Figure 4 also confirms the validity of Assumption 4 for $\alpha = 0.3$ and 0.6.

**Example 3.5.** By Theorem 2.2 (i), the bivariate function

$$C(u, v; \alpha, \beta, \theta) = uv[1 + \alpha(1-u)(1-v) + \beta(1-u)^2(1-v)^2]$$
$$\times e^{\theta(1-e^{-u})(e^{-1-e^{-v})}}$$

(3.8)
is a copula for $0 \leq \theta \leq 1$, $0 \leq \beta \leq 0.5$ and $0 \leq \alpha \leq 1 - e^{-1}$. Similar to Example 3.3, $\phi(u) = e^{-1} - e^{-u}$ and the boundary condition holds and

$$K(u, v; \alpha, \beta) = uv[1 + \alpha(1-u)(1-v) + \beta(1-u)^2(1-v)^2]$$

is a copula for $|\alpha| \leq 1$, $\alpha + \beta \geq -1$ and $\beta \leq \frac{3 - \alpha + \sqrt{9 - 6\alpha - 3\alpha^2}}{2}$ with

$$\frac{\partial^2}{\partial u \partial v} \ln K(u, v; \alpha, \beta) = \frac{\alpha + 4\beta(1-u)(1-v) + \alpha \beta(1-u)^2(1-v)^2}{1 + \alpha(1-u)(1-v) + \beta(1-u)^2(1-v)^2} \geq 0,$$

for $0 \leq \alpha \leq 1$ and $0 \leq \beta \leq \frac{3 - \alpha + \sqrt{9 - 6\alpha - 3\alpha^2}}{2}$. Now, we define

$$s(u, v; \alpha, \beta) = \frac{\partial}{\partial u} \ln K(u, v; \alpha, \beta) - e^{-u} = \frac{1}{u} \frac{\alpha(1-v) + 2\beta(1-u)(1-v)^2}{1 + \alpha(1-u)(1-v) + \beta(1-u)^2(1-v)^2} - e^{-u} = g(u) - f_2(u, v; \alpha, \beta),$$

where $g(u) = \frac{1}{u} - e^{-u} > 0$ and

$$f_2(u, v; \alpha, \beta) = \frac{\alpha(1-v) + 2\beta(1-u)(1-v)^2}{1 + \alpha(1-u)(1-v) + \beta(1-u)^2(1-v)^2} \geq 0,$$

for $0 \leq \alpha \leq 1$ and $0 \leq \beta \leq \frac{3 - \alpha + \sqrt{9 - 6\alpha - 3\alpha^2}}{2}$. $f_2$ is a decreasing function in $v$ for $0 \leq \alpha \leq 1$ and $0 \leq \beta \leq 1$, because

$$\frac{\partial}{\partial v} f_2(u, v; \alpha, \beta)$$
A large class of new bivariate copulas and their properties

\[ A = 1 + \alpha(1-u)(1-v) + \beta(1-u)^2(1-v)^2 > 0. \]  

So, it is sufficient to investigate the behavior of \( f_2(u,0;\alpha,\beta) \). This function will be increasing, decreasing or upsidedown U-shaped in \( u \), depending on different values of \( \alpha \) and \( \beta \). Thus, we consider two cases: (i) \( f_2(u,0;\alpha,\beta) \) is an increasing or decreasing function and (ii) \( f_2(u,0;\alpha,\beta) \) is upsidedown U-shaped function in \( u \).

For case (i), since \( g \) is decreasing very fast, we just investigate the sign of \( s(u,v;\alpha,\beta) \) for \( u = 0 \) and \( u = 1 \) and conclude that \( s(u,v;\alpha,\beta) \geq 0 \) for \( u,v \in [0,1] \), \( 0 \leq \alpha \leq 1 - e^{-1} \).

\begin{align*}
\end{align*}

Figure 5 Illustrations of \( s(u,v;\alpha,\beta) \).

In case (ii), we note that \( f_2 \) is an increasing function in \( \alpha \) and \( \beta \). So, we define

\[ h(u) = f_2(u,0;1 - e^{-1},0.5) = \frac{2 - u - e^{-1}}{1 + (1 - e^{-1})(1 - u) + 0.5(1 - u)^2}. \]

\( h(u) \) has a maximum at \( u_0 = 0.3670 \) and

\[ h(u) \geq \frac{\alpha + 2\beta(1-u)}{1 + \alpha(1-u) + \beta(1-u)^2}, \quad \alpha \in [0,1 - e^{-1}], \quad \beta \in [0,0.5]. \]
Thus, since \( g(u) \) is decreasing very fast compared to \( h(u) \), we just plot \( g(u) \) and \( h(u) \) for \( u \in [0.5, 1] \), in Figure 5(a). Then, we have

\[
g(u) - h(u) \geq 0, \forall u \in [0, 1].
\]

Hence, we conclude that \( s(u, v; \alpha, \beta) \geq 0 \) for \( \alpha \in [0, 1 - e^{-1}] \) and \( \beta \in [0, 0.5] \). Moreover, Figure 5(b-c) confirms the validity of Assumption 4 of Theorem 2.2 (a) for certain values of the parameters.

**Example 3.6.** The bivariate function

\[
C(u, v; \theta, \alpha, \beta) = uv[1 + \alpha(1-u)(1-v) + \beta(1-u)^2(1-v)^2] \\
\times e^{\theta(1-u)(1-v)},
\]

(3.9)
is a copula for \( \theta \in [-1, 0] \), \( \alpha \in [0, 1] \) and \( \beta \in [-1, 1] \). In this example, \( \phi(u) = 1 - u \) and clearly the boundary condition and Assumption 3 of Theorem 2.2 (ii) hold and

\[
K(u, v; \alpha, \beta) = uv[1 + \alpha(1-u)(1-v) + \beta(1-u)^2(1-v)^2]
\]
is a copula for \( \alpha \leq 1, \alpha + \beta \geq -1 \) and \( \beta \leq \frac{3 - \alpha + \sqrt{9 - 6\alpha - 3\alpha^2}}{2} \). Now, to check the validity of Assumption 5, we define

\[
g(u, v; \alpha, \beta) = \frac{k(u, v; \alpha, \beta)}{K(u, v; \alpha, \beta)} - 1 = \frac{k(u, v; \alpha, \beta) - K(u, v; \alpha, \beta)}{K(u, v; \alpha, \beta)}
\]

\[
= \frac{1}{K(u, v; \alpha, \beta)} \left[ 1 + \alpha(1-u)(1-v) + \beta(1-u)^2(1-v)^2 \\
- (u + v - 2uv)[\alpha + 2\beta(1-u)(1-v)] + uv[\alpha + 4\beta(1-u)] \\
\times (1-v) \right] \\
+ \frac{1}{K(u, v; \alpha, \beta)} \left[ uv[1 + \alpha(1-u)(1-v) + \beta(1-u)^2(1-v)^2] \right].
\]

First, let \( 0 \leq \beta \leq 1 \), we have

\[
g(u, v; \alpha, \beta) = \left[ \frac{f_1(u, v; \alpha, \beta) - f_2(u, v; \alpha, \beta)}{K(u, v; \alpha, \beta)} \right] = \frac{F(u, v; \alpha, \beta)}{K(u, v; \alpha, \beta)},
\]

where

\[
f_1(u, v; \alpha, \beta) = 1 + \alpha(1-u)(1-v) + \beta(1-u)^2(1-v)^2 \\
+ uv[\alpha + 4\beta(1-u)(1-v)] \\
\geq 0,
\]

\[
f_2(u, v; \alpha, \beta) = uv[1 + \alpha(1-u)(1-v) + \beta(1-u)^2(1-v)^2] \\
+ (u + v - 2uv)[\alpha + 2\beta(1-u)(1-v)] \\
\geq 0
\]

and

\[
F(u, v; \alpha, \beta) = f_1(u, v; \alpha, \beta) - f_2(u, v; \alpha, \beta).
\]
$f_1$ and $f_2$ are increasing functions in $\alpha$ and $\beta$. Moreover, $f_1$ and $f_2$ are linear functions of $\alpha$ and $\beta$. So, to find the signs of $g$, it is sufficient to investigate the signs of $F(u, v; 0, 0)$ and $F(u, v; 1, 1)$. Hence, we have

$$F(u, v; 0, 0) = 1 - uv \geq 0, \quad u, v \in [0, 1]$$

$$F(u, v; 1, 1) = \left[1 + (1 - u)(1 - v) + (1 - u)^2(1 - v)^2(1 - uv) + 4uv \right. \times (1 - u)(1 - v) - \left[1 + 2(1 - u)(1 - v)](u + v - 2uv) + uv\right.$$

$$\geq 0, \quad u, v \in [0, 1].$$

Figure 6(a) illustrates $F(u, v; 1, 1) \geq 0$ for $u, v \in [0, 1]$. Thus, $g \geq 0$ and hence Assumption 5 holds for $0 \leq \beta \leq 1$.

Now, we let $-1 \leq \beta < 0$ and

$$g(u, v; \alpha, \beta) = \frac{f_3(u, v; \alpha, \beta) - f_4(u, v; \alpha, \beta)}{K(u, v; \alpha, \beta)} = \frac{G(u, v; \alpha, \beta)}{K(u, v; \alpha, \beta)},$$

where

$$f_3(u, v; \alpha, \beta) = 1 + \alpha(1 - u)(1 - v) + \alpha uv - 2\beta(1 - u)(1 - v)$$

$$\times (u + v - 2uv) - \beta uv(1 - u)^2(1 - v)^2 \geq 0,$$

$$f_4(u, v; \alpha, \beta) = \alpha(u + v - 2uv) + uv[1 + \alpha(1 - u)(1 - v)]$$

$$- \beta(1 - u)^2(1 - v)^2 - 4\beta uv(1 - u)(1 - v) \geq 0$$

and

$$G(u, v; \alpha, \beta) = f_3(u, v; \alpha, \beta) - f_4(u, v; \alpha, \beta).$$
$f_3$ and $f_4$ are increasing functions in $\alpha$ and decreasing functions in $\beta$. Moreover, these functions are linear with respect to $\alpha$ and $\beta$. So, similar to the previous case, it is sufficient to investigate the signs of $G(u, v; 0, 0)$ and $G(u, v; 1, -1)$. Here, we have

$$G(u, v; 0, 0) = 1 - uv \geq 0, \quad u, v \in [0, 1]$$

$$G(u, v; 1, -1) = 1 + (1 - u)(1 - v) - (1 - u)^2(1 - v)^2 + uv[1 - 4(1 - u) \times (1 - v)] - (u + v - 2uv)[1 - 2(1 - u)(1 - v)] - uv \times (1 - u)(1 - v) + uv(1 - u)^2(1 - v)^2 \geq 0, \quad u, v \in [0, 1].$$

This is illustrated by Figure 6(b). Then, we conclude that $g(u, v; \alpha, \beta) \geq 0$, for $\alpha \in [0, 1]$ and $\beta \in [-1, 1]$. Moreover, Figure 7 also illustrates that $G(u, v; \alpha, \beta) \geq 0$ for certain values of $\alpha$ and $\beta$.

![Figure 7 Illustrations of $G(u, v; \alpha, \beta)$](image)

It is also noted that, based on Theorem 2.2 (ii), the bivariate functions

$$C(u, v; \alpha, \theta) = uv[1 + \alpha(u^2 - 1)(v^2 - 1)]e^{\theta(1-u)(1-v)},$$

where $0 \leq \alpha \leq 0.45, -1 \leq \theta \leq 0$ (3.10)

and

$$C(u, v; \delta, \theta) = uv[1 + \delta(1 - u^{0.5})(1 - v^{0.5})]e^{\theta(1-u)(1-v)},$$

where $0 \leq \delta \leq 2, -1 \leq \theta \leq 0$ (3.11)
A large class of new bivariate copulas and their properties

Remark 3.1. An important feature of the family introduced here is that it is very large so that it contains many copulas, several but not all Archimedean copulas included. For instance, by our Theorems 2.1 and 2.2 it follows that

\[
C(u, v; \delta, \theta, \gamma) = uv[1 + \delta(1 - u)^2(1 - v)^2][1 + \theta(1 - u)(1 - v)]^\gamma
\]

\[\text{for } 0 \leq \delta \leq 1, \quad 0 \leq \theta \leq 1, \quad \gamma \geq 1, \quad \gamma \leq -1, \quad \delta = 0, \quad -1 \leq \theta \leq 1, \quad \gamma \leq -1, \quad 0 \leq \theta \leq 1, \quad 0 \leq \gamma \leq 1 \quad \text{(3.12)}\]

is a bivariate copula which is not Archimedean. However, in the special case when \(\delta = 0\) and \(\gamma = 1\) it reduces to FGM (the first order approximation to the Frank copula, which is Archimedean) and when \(\delta = 0\) and \(\gamma = -1\) it reduces to the Archimedean copula AMH. Also, by Theorem 2.4, the bivariate function

\[
C(u, v; \delta, \theta) = uve^{-\left\{(-\ln(u))^{-\delta}(-\ln(v))^{-\delta}\right\}} e^{\theta \ln(u)\ln(v)}, \quad 0 < \delta \leq 1, \quad 0 \leq \theta \leq 1
\]

\[\text{for } C(u, v; \delta, \theta) \quad \text{(3.13)}\]

is a bivariate copula but it is not Archimedean in general. In the special case when \(\theta = 0\), it reduces to Galambos copula and when \(\delta \to 0\) reduces to BG copula which is an Archimedean copula.

Remark 3.2. Note that when \(\phi\) is unbounded, such as \(\ln(u)\), for any values of \(\gamma\)

\[
R(u, v; \gamma) = \phi(u) + \frac{\phi'(u)}{\gamma} \frac{\partial}{\partial u} \ln K(u, v), \forall u, v \in I
\]

does not lie between \([-1, 1]\) and thus \(C\) is empty. Consequently, \(C\) is not a copula. Even if \(\phi\) is bounded, \(\phi'\) may be unbounded such as

\[
\phi(u) = (1 - u)^k, \quad 0 < k < 1
\]

in which case again \(C\) is empty. As another instance, let \(\phi\) and \(\phi'\) be bounded, e.g., \(\phi = 1 - u\), but \(K\) be the Clayton copula

\[
K(u, v; \theta) = (u^{-\theta} + v^{-\theta})^{-\frac{1}{\theta}}.
\]
Here, we have
\[ R(u, v; \theta, \gamma) = 1 - u - \frac{u^{\theta + 1}(u^{-\theta} + v^{-\theta})}{\gamma}, \]
which can be unbounded for \( v = 0 \) and thus \( G \) is empty.
Similarly, for \( Q_0, Q_1 \) and \( Q_2 \) to be empty, one can consider \( \phi(u) = 1 - u \) and \( K \) as the Galambos copula.

4 Dependence Properties

In this section, we shall investigate dependence properties of our new class of copulas. We shall show that, under certain conditions, dependent properties of \( C(u, v) \) are the same as those of \( K(u, v) \). First we need to recall some known concepts of dependencies.

**Definition 4.1.** Let r.v.’s \( X \) and \( Y \) be related by a copula \( C(u, v) \). Then,
1. \( X \) and \( Y \) are Positively Quadrant Dependent (PQD) (Negatively Quadrant Dependent (NQD)), if
   \[ \forall (x, y) \in \mathbb{R}^2, \quad P(X \leq x, Y \leq y) \geq (\leq)P(X \leq x)P(Y \leq y) \quad (4.1) \]
   or, equivalently,
   \[ \forall (u, v) \in I^2, \quad C(u, v) \geq (\leq)uv. \quad (4.2) \]
2. \( Y \) is Left Tail Decreasing (LTD) in \( X \) if \( P(Y \leq y|X \leq x) \) is non-increasing in \( x \) for all \( y \).
3. \( X \) and \( Y \) are Left Corner Set Decreasing (LCSD) if \( P(X \leq x, Y \leq y|X \leq x', Y \leq y') \) is non-increasing in \( x' \) and \( y' \) for all \( x \) and \( y \).
4. \( Y \) is Stochastically Increasing (SI) in \( X \) if \( P(Y > y|X = x) \) is non-decreasing in \( x \) for all \( y \).

**Theorem 4.1.** Let either \( \forall u \in I, \phi(u) \geq 0 \) or \( \forall u \in I, \phi(u) \leq 0 \).
(1) If \( \theta \gamma \geq 0 \) (\( \theta \gamma \leq 0 \)), then PQD (NQD) property of \( K(u, v) \) is preserved by \( C(u, v; \theta, \gamma) = K(u, v)[1 + \theta \phi(u)\phi(v)]^{\frac{\gamma}{2}} \).
(2) If \( \theta \in [0, 1] \), then PQD (NQD) property of \( K(u, v) \) is preserved by \( C(u, v; \theta) = K(u, v)e^{\theta \phi(u)\phi(v)} \).

**Proof.** (i) Suppose that \( \gamma > 0 \) and \( 0 \leq \theta \leq 1 \), then
   \[ 1 + \theta \phi(u)\phi(v) \geq 1 \quad \forall u, v \in I, \]
A large class of new bivariate copulas and their properties

and, thus,

\[ [1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma}} \geq 1 \quad \forall u, v \in I. \]

Hence, if \( K(u, v) \) is \( PQD \), it follows that

\[ C(u, v; \theta, \gamma) = K(u, v)[1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma}} \geq uv \quad \forall u, v \in I, \]

as required. For \( \gamma < 0 \) and \(-1 \leq \theta \leq 0\), we have

\[ 0 \leq 1 + \theta \phi(u)\phi(v) \leq 1, \]

or, equivalently,

\[ [1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma}} \geq 1. \]

Thus, if \( K(u, v) \) is \( PQD \), it follows that

\[ K(u, v)[1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma}} \geq uv \quad \forall u, v \in I, \]

as required. For \( \gamma > 0 \) and \( 0 \leq \theta \leq 1 \), we have

\[ 1 + \theta \phi(u)\phi(v) \geq 1, \]

or, equivalently,

\[ [1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma}} \leq 1. \]

If \( K(u, v) \) is \( NQD \), it follows that

\[ K(u, v)[1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma}} \leq uv \quad \forall u, v \in I, \]

as required. For \( \gamma > 0 \) and \(-1 \leq \theta \leq 0\), we have

\[ 0 \leq 1 + \theta \phi(u)\phi(v) \leq 1. \]

Thus, if \( K(u, v) \) is \( NQD \), we have

\[ K(u, v)[1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma}} \leq uv \quad \forall u, v \in I. \]

i.e. \( C(u, v; \theta, \gamma) \) is \( NQD \).

(ii) For \( \theta \in [0, 1][\theta \in [-1, 0]] \), \( e^{\theta \phi(u)\phi(v)} \geq 1(\leq 1) \). Thus, if \( K(u, v) \) is \( PQD(NQD) \), \( C(u, v; \theta) \) is also \( PQD(NQD) \). \( \square \)
First, in what follows assume that $X$ and $Y$ are related according to copula 
$C(u,v;\theta,\gamma) = K(u,v)[1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma}}$ and $X'$ and $Y'$ are related according 
to the corresponding base copula $K$.

**Theorem 4.2.** Let $\phi : [0,1] \rightarrow [-1,1]$ be a differentiable function and 
$\theta, \gamma > 0$. Then 
(i) $Y$ is LTD $X$ if $Y'$ is LTD in $X'$ and $\phi$ is positive and non-increasing 
or negative and non-decreasing.
(ii) $X$ and $Y$ are LCSD if $X'$ and $Y'$ are LCSD and $\phi$ is positive and 
non-increasing or negative and non-decreasing.
(iii) $Y$ is SI in $X$ if $Y'$ is SI in $X'$ and $\phi$ is positive, non-increasing and 
concave or negative, non-decreasing and convex for $0 \leq \theta \leq 1$ and $\gamma \geq 1$.

**Proof.** (i) By Theorem 5.2.5 in Nelsen (2006), it is sufficient to prove that 
$\frac{C(u,v;\theta,\gamma)}{u}$ is non-increasing in $u$ for all $v \in I$. Since 
\[
\frac{C(u,v;\theta,\gamma)}{u} = \frac{K(u,v)}{u}[1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma}}
\] 
according to the condition of the theorem, $\frac{K(u,v)}{u}$ is non-increasing in $u$. 
Obviously $[1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma}}$ is also non-increasing in $u$, because 
\[
\frac{d}{du}[1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma}} = \frac{\theta \phi(u)\phi(v)[1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma} - 1}}{\gamma} \leq 0.
\] 
(ii) By Corollary 5.2.17 in Nelsen (2006), we should show that for all 
$0 \leq u_1 \leq u_2 \leq 1$ and $0 \leq v_1 \leq v_2 \leq 1$,
\[
C(u_1,v_1;\theta,\gamma)C(u_2,v_2;\theta,\gamma) - C(u_1,v_2;\theta,\gamma)C(u_2,v_1;\theta,\gamma) \geq 0,
\] 
or equivalently,
\[
K(u_1,v_1)K(u_2,v_2)[[1 + \theta \phi(u_1)\phi(v_1)][1 + \theta \phi(u_2)\phi(v_2)]^{\frac{1}{\gamma}} - K(u_1,v_2)K(u_2,v_1)[[1 + \theta \phi(u_1)\phi(v_2)][1 + \theta \phi(u_1)\phi(v_2)]^{\frac{1}{\gamma}} \geq 0.
\] 
(4.4)
First, suppose that $0 \leq \theta \leq 1$ and $\gamma \geq 0$. Since $X'$ and $Y'$ are LCSD, it is 
sufficient to show that 
\[
\{[1 + \theta \phi(u_1)\phi(v_1)][1 + \theta \phi(u_2)\phi(v_2)]^{\frac{1}{\gamma}} \geq \{[1 + \theta \phi(u_1)\phi(v_2)]
\times [1 + \theta \phi(u_2)\phi(v_1)]^{\frac{1}{\gamma}},
\]
A large class of new bivariate copulas and their properties

or, equivalently,
\[ [\phi(v_2) - \phi(v_1)][\phi(v_2) - \phi(u_1)] \geq 0. \]  

(4.5)

But, by monotonicity of \( \phi \), (4.5) obviously holds and, thus, we have the result. By the same argument, (4.4) holds for \(-1 \leq \theta \leq 0\) and \(\gamma \leq 0\).

(iii) By Corollary 5.2.11 in Nelsen (2006) we should show that \( \frac{\partial C(u,v)}{\partial u} \) is non-increasing in \( u \). But, we have
\[
\frac{\partial C(u,v;\gamma)}{\partial u} = \frac{\partial}{\partial u} \left\{ K(u,v)[1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma}} \right\} \\
= \frac{\partial K(u,v)}{\partial u} \left[ 1 + \theta \phi(u)\phi(v) \right]^{\frac{1}{\gamma}} + \frac{K(u,v)}{u} \left\{ \theta \gamma u \phi(v)\phi'(u)[1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma} - 1} \right\}.  
\]  

(4.6)

(4.7)

Since \( Y' \) is SI in \( X' \) and SI implies LTD (Corollary 5.2.17 in Nelsen, 2006), \( \frac{\partial K(u,v)}{\partial u} \) and \( \frac{K(u,v)}{u} \) are non-increasing. Expressions I and II are also non-increasing because
\[
\frac{\partial}{\partial u} [1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma}} = \theta \gamma \phi'(u)\phi(v)[1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma} - 1} \leq 0  
\]  

(4.8)

and
\[
\frac{\partial}{\partial u} \left\{ \theta \gamma u \phi(v)\phi'(u)[1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma} - 1} \right\} = \theta \gamma \phi'(u)\phi(v)[1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma} - 1} \\
+ \frac{\theta}{\gamma} \phi''(u)u \phi(v)[1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma} - 1} + \frac{\theta^2}{\gamma^2} (1 - \gamma) (\phi'(u))^2 (\phi(v))^2 u \\
\times [1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma} - 2} \leq 0. 
\]  

(4.9)

Consequently, by (4.8) and (4.9), the Expressions (4.6) and (4.7) are non-increasing in \( u \). This completes the proof.

Now, in what follows, we assume that \( X \) and \( Y \) are related according to copula \( C(u,v;\theta) = K(u,v)e^{\theta \phi(u)\phi(v)} \) and \( X' \) and \( Y' \) are related according to the corresponding base copula \( K \).

Theorem 4.3. Let \( \phi \) be a differentiable function and \( 0 \leq \theta \leq 1 \). Then
(i) \( Y \) is LTD in \( X \) if \( Y' \) is LTD in \( X' \) and \( \phi \) is positive and non-increasing
or negative and non-decreasing.

(ii) $Y$ is LCSD in $X$ if $Y'$ is LCSD in $X'$ and $\phi$ is positive and non-increasing or negative and non-decreasing.

**Proof.** (i) It is sufficient to prove that $\frac{C(u,v;\theta)}{u}$ is non-increasing in $u$. According to the condition of the Theorem, $\frac{K(u,v)}{u}$ is non-increasing in $u$ and obviously $e^{\theta\phi(u)\phi(v)}$ is non-increasing in $u$ too, because we have

$$\frac{\partial}{\partial u} e^{\theta\phi(u)\phi(v)} = \theta \phi'(u) \phi(v) e^{\theta\phi(u)\phi(v)} \leq 0.$$ 

Hence,

$$\frac{C(u,v;\theta)}{u} = \frac{K(u,v)}{u} e^{\theta\phi(u)\phi(v)}$$

is non-increasing.

(ii) Similar to the proof of Theorem 4.2 (ii).

\[\square\]

5 Tail Dependence

In this section, we consider two concepts of dependencies that measure the amount of dependency in the upper-right quadrant and lower-right quadrant on $I^2$ and show that upper tail dependence coefficient of $(X,Y)$ equals to that of $(X',Y')$.

**Definition 5.1.** Let $X$ and $Y$ be continuous random variables with d.f.'s $F$ and $G$, respectively. The upper tail dependence $\lambda_U$ is defined by

$$\lambda_U = \lim_{u \to 1} P[Y > G^{-1}(u)|X > F^{-1}(u)],$$

or, equivalently,

$$\lambda_U = 2 - \lim_{u \to 1} \frac{1 - C(u,u)}{1 - u}.$$ 

Similarly, lower tail dependence $\lambda_L$ is defined by

$$\lambda_L = \lim_{u \to 0^+} P[Y \leq G^{-1}(u)|X \leq F^{-1}(u)],$$

or, equivalently,

$$\lambda_L = \lim_{u \to 0^+} \frac{C(u,u)}{u}.$$
In the following theorem, we assume that $\lambda_{U,K}$ and $\lambda_{L,K}$ are upper and lower tail dependencies of copula $K(u,v)$, and $\lambda_{U,C}$ and $\lambda_{L,C}$ are those of copula $C(u,v;\theta,\gamma)$ (or $C(u,v;\theta)$).

**Theorem 5.1.** i) If $C(u,v;\theta,\gamma) = K(u,v)[1 + \theta \phi(u)\phi(v)]^{\frac{1}{\gamma}}$ for $\gamma \neq 0$, then $\lambda_{U,C} = \lambda_{U,K}$, $\lambda_{L,C} = \lambda_{L,K}[1 + \theta \phi(0)]^{\frac{1}{\gamma}}$.

ii) if $C(u,v;\theta) = K(u,v)e^{\theta \phi(u)\phi(v)}$, then $\lambda_{U,C} = \lambda_{U,K}$, $\lambda_{L,C} = \lambda_{L,K}e^{\theta \phi^2(0)}$.

**Proof.** (i) We have

\[\lambda_{U,C} = 2 - \lim_{u \to 1^-} \frac{1 - C(u,u)}{1 - u} = 2 - \lim_{u \to 1^-} \frac{1 - K(u,u)[1 + \theta \phi^2(u)]^{\frac{1}{\gamma}}}{1 - u},\]

\[= 2 - \lim_{u \to 1^-} \left\{ \frac{\partial}{\partial u} K(u,u)[1 + \theta \phi^2(u)]^{\frac{1}{\gamma}} + \frac{2\theta}{\gamma} K(u,u) \phi(u) \phi'(u) \right\} \times \frac{[1 + \theta \phi^2(u)]^{\frac{1}{\gamma} - 1}}{[1 + \theta \phi^2(u)]^{\frac{1}{\gamma}} - 1} = 2 - \lim_{u \to 1^-} \frac{\partial}{\partial u} K(u,u) = \lambda_{U,K}\]

and

\[\lambda_{L,C} = \lim_{u \to 0^+} \frac{C(u,u)}{u} = \lim_{u \to 0^+} \frac{\partial}{\partial u} C(u,u),\]

\[= \lim_{u \to 0^+} \left\{ \frac{\partial}{\partial u} K(u,u)[1 + \theta \phi^2(u)]^{\frac{1}{\gamma}} + \frac{2\theta}{\gamma} K(u,u) \phi(u) \phi'(v) \right\} \times \frac{[1 + \theta \phi^2(u)]^{\frac{1}{\gamma} - 1}}{[1 + \theta \phi^2(u)]^{\frac{1}{\gamma}} - 1} = (\lim_{u \to 0^+} \frac{\partial}{\partial u} K(u,u))[1 + \theta \phi^2(0)]^{\frac{1}{\gamma}} = \lambda_{L,K}[1 + \theta \phi^2(0)]^{\frac{1}{\gamma}}.\]

As required. The prove of part (ii) is similar. \qed

6 Measures of association

In this section, we obtain Spearman’s $\rho_s$ for our new copulas for certain values of their parameters. As theoretical calculations are not feasible here, we shall use a Maple software to compute $\rho_s$ numerically. Our new copulas prove to improve the range of correlation coefficient of the FGM family. Recall that Spearman’s $\rho_s$ is defined by

\[\rho_s = 12 \int_0^1 \int_0^1 C(u,v)udu dv - 3.\]
Example 6.1.

- 6.1.1 Consider the copula in (3.1). The Spearman’s \( \rho_s \) calculated for various values of \( k, \delta, \theta \) and \( \gamma \) appear in Table 2. Here, \( \rho_s \) is an increasing function in \( \delta \) and \( k \), increasing(decreasing) function in \( \theta \) when \( \gamma \geq 0 (\gamma \leq 0) \) and increasing(decreasing) function in \( \gamma \) when \( \theta \leq 0 (\theta \geq 0) \). Furthermore, by Theorem 4.1, \( C(u,v;k,\delta,\theta,\gamma) \) is PQD. So, \( \rho_s \in [0,0.5116] \).

- 6.1.6 Consider the copula in (3.9). $\rho_s$ is increasing in $\alpha$, $\beta$ and $\theta$. As seen in Table 7, the maximum of $\rho_s$ equals 0.4167 which is greater than the upper bound of an FGM copula and the minimum of $\rho_s$ equals -0.3552 which is less than the lower bound of an FGM copula.

- 6.1.7 Consider the copula in (3.10). $\rho_s$ is an increasing in $\delta$ and $\theta$. Hence, as we see in Table 7, $\rho_s \in [-0.2962, 0.3375]$.

Remark 6.1. For copula (3.12) which contains FGM and AMH, $\rho_s \in [-0.28, 0.4784]$.

Conclusion

In this study, we started with a rather arbitrary base bivariate copula and found sufficient and necessary conditions under which two new classes of bivariate functions would be copulas. In particular, they include various already known copulas previously studied in the literature such as FGM, AMH and BG. Dependence properties of variables involved were investigated and revealed that the dependent properties of the base copula are preserved by the generated copula under certain conditions. Furthermore, we have provided several examples and computed the values of Spearman’s $\rho_s$ as
measures of association. It is shown that the proposed copulas improve this range of $\rho_s$ comparing to FGM copula.
