THE ANNALS OF PROBABILITY

Vol. 51, No. 6, pp. 1993–2395 November 2023

INSTITUTE OF MATHEMATICAL STATISTICS

(Organized September 12, 1935)

The purpose of the Institute is to foster the development and dissemination of the theory and applications of statistics and probability.

IMS OFFICERS

President: Michael Kosorok, Department of Biostatistics and Department of Statistics and Operations Research, University of North Carolina, Chapel Hill, Chapel Hill, NC 27599, USA

President-Elect: Tony Cai, Department of Statistics and Data Science, University of Pennsylvania, Philadelphia, PA 19104-6304, USA

Past President: Peter Bühlmann, Seminar für Statistik, ETH Zürich, 8092 Zürich, Switzerland

Executive Secretary: Peter Hoff, Department of Statistical Science, Duke University, Durham, NC 27708-0251, USA

Treasurer: Jiashun Jin, Department of Statistics, Carnegie Mellon University, Pittsburgh, PA 15213-3890, USA

Program Secretary: Annie Qu, Department of Statistics, University of California, Irvine, Irvine, CA 92697-3425, USA

PARKING ON CAYLEY TREES AND FROZEN ERDŐS–RÉNYI

BY ALICE CONTAT^a AND NICOLAS CURIEN^b

Laboratoire de Mathématique d'Orsay, Université Paris-Saclay, ^aalice.contat@universite-paris-saclay.fr,
^bnicolas.curien@gmail.com

Consider a uniform rooted Cayley tree T_n with n vertices and let m cars arrive sequentially, independently, and uniformly on its vertices. Each car tries to park on its arrival node, and if the spot is already occupied, it drives towards the root of the tree and parks as soon as possible. Lackner and Panholzer (*J. Combin. Theory Ser. A* **142** (2016) 1–28) established a phase transition for this process when $m \approx \frac{n}{2}$. In this work, we couple this model with a variant of the classical Erdős–Rényi random graph process. This enables us to describe the phase transition for the size of the components of parked cars using a modification of the multiplicative coalescent which we name the *frozen multiplicative coalescent*. The geometry of critical parked clusters is also studied. Those trees are very different from Bienaymé–Galton–Watson trees and should converge towards the growth-fragmentation trees canonically associated to the $3/2$ -stable process that already appeared in the study of random planar maps.

ON THE (NON)STATIONARY DENSITY OF FRACTIONAL-DRIVEN STOCHASTIC DIFFERENTIAL EQUATIONS

BY XUE-MEI LI^{1,a}, FABIEN PANLOUP^{2,c} AND JULIAN SIEBER^{1,b}

¹Department of Mathematics, Imperial College London, ^axue-mei.li@epfl.ch, ^bj.sieber19@imperial.ac.uk

²Univ. Angers, CNRS, LAREMA, SFR MATHSTIC, ^cfabien.panloup@univ-angers.fr

We investigate the stationary measure π of SDEs driven by additive fractional noise with any Hurst parameter and establish that π admits a smooth Lebesgue density obeying both Gaussian-type lower and upper bounds. The proofs are based on a novel representation of the stationary density in terms of a Wiener–Liouville bridge, which proves to be of independent interest: We show that it also allows to obtain Gaussian bounds on the nonstationary density, which extend previously known results in the additive setting. In addition, we study a parameter-dependent version of the SDE and prove smoothness of the stationary density, jointly in the parameter and the spatial coordinate. With this, we revisit the fractional averaging principle of Li and Sieber (*Ann. Appl. Probab.* **32** (2022) 3964–4003) and remove an ad hoc assumption on the limiting coefficients. Avoiding any use of Malliavin calculus in our arguments, we can prove our results under minimal regularity requirements.

LOEWNER EVOLUTION DRIVEN BY COMPLEX BROWNIAN MOTION

BY EWAIN GWYNNE^{1,a} JOSHUA PFEFFER^{2,c} AND MINJAE PARK^{1,b}

¹Department of Mathematics, University of Chicago, ^aewain@uchicago.edu, ^bminjaep@uchicago.edu

²Department of Mathematics, Columbia University, ^cjpfeffer@math.columbia.edu

We study the Loewner evolution whose driving function is $W_t = B_t^1 + iB_t^2$, where (B^1, B^2) is a pair of Brownian motions with a given covariance matrix. This model can be thought of as a generalization of Schramm–Loewner evolution (SLE) with complex parameter values. We show that our Loewner evolutions behave very differently from ordinary SLE. For example, if neither B^1 nor B^2 is identically equal to zero, then the set of points disconnected from ∞ by the Loewner hull has nonempty interior at each time. We also show that our model exhibits three phases analogous to the phases of SLE: a phase where the hulls have zero Lebesgue measure, a phase where points are swallowed but not hit by the hulls and a phase where the hulls are space-filling. The phase boundaries are expressed in terms of the signs of explicit integrals. These boundaries have a simple closed form when the correlation of the two Brownian motions is zero.

MULTISOURCE INVASION PERCOLATION ON THE COMPLETE GRAPH

BY LOUIGI ADDARIO-BERRY^a AND JORDAN BARRETT^b

Department of Mathematics and Statistics, McGill University, ^alouigi.addario@mcgill.ca, ^bjordan.barrett@mail.mcgill.ca

We consider invasion percolation on the complete graph K_n , started from some number $k(n)$ of distinct source vertices. The outcome of the process is a forest consisting of $k(n)$ trees, each containing exactly one source. Let M_n be the size of the largest tree in this forest. Logan, Molloy and Pralat (2018) proved that if $k(n)/n^{1/3} \rightarrow 0$ then $M_n/n \rightarrow 1$ in probability. In this paper, we prove a complementary result: if $k(n)/n^{1/3} \rightarrow \infty$, then $M_n/n \rightarrow 0$ in probability. This establishes the existence of a phase transition in the structure of the invasion percolation forest around $k(n) \asymp n^{1/3}$.

Our arguments rely on the connection between invasion percolation and critical percolation, and on a coupling between multisource invasion percolation with differently-sized source sets. A substantial part of the proof is devoted to showing that, with high probability, a certain fragmentation process on large random binary trees leaves no components of macroscopic size.

ISOMORPHISMS OF POISSON SYSTEMS OVER LOCALLY COMPACT GROUPS

BY AMANDA WILKENS^a

For my brother, Daniel, and in memory of him.

Mathematics, University of Texas at Austin, ^aamanda.wilkens@math.utexas.edu

A Poisson system is a Poisson point process and a group action, together forming a measure-preserving dynamical system. Ornstein and Weiss proved Poisson systems over many amenable groups were isomorphic in their 1987 paper. We consider Poisson systems over nondiscrete, noncompact, locally compact Polish groups, and we prove by construction all Poisson systems over such a group are finitarily isomorphic, producing examples of isomorphisms for nonamenable group actions. As a corollary, we prove Poisson systems and products of Poisson systems are finitarily isomorphic.

For a Poisson system over a group belonging to a slightly more restrictive class than above, we further prove it splits into two Poisson systems whose intensities sum to the intensity of the original, generalizing the same result for Poisson systems over Euclidean space proved by Holroyd, Lyons and Soo.

We establish a precise three-term asymptotic expansion, with an optimal estimate of the error term, for the rightmost eigenvalue of an $n \times n$ random matrix with independent identically distributed complex entries as n tends to infinity. All terms in the expansion are universal.

ESSENTIAL ENHANCEMENTS IN ABELIAN NETWORKS: CONTINUITY AND UNIFORM STRICT MONOTONICITY

BY LORENZO TAGGI^a

Dipartimento di Matematica ‘Guido Castelnuovo’, Sapienza Università di Roma, ^alorenzo.taggi@uniroma1.it

We prove that in wide generality the critical curve of the activated random walk model is a continuous function of the deactivation rate, and we provide a bound on its slope, which is uniform with respect to the choice of the graph. Moreover, we derive strict monotonicity properties for the probability of a wide class of “increasing” events, extending previous results of (*Invent. Math.* **188** (2012) 127–150). Our proof method is of independent interest and can be viewed as a reformulation of the ‘essential enhancements’ technique, which was introduced for percolation, in the framework of abelian networks.

THE CRITICAL 2D STOCHASTIC HEAT FLOW IS NOT A GAUSSIAN MULTIPLICATIVE CHAOS

BY FRANCESCO CARAVENNA^{1,a}, RONGFENG SUN^{2,b} AND NIKOS ZYGOURAS^{3,c}

¹*Dipartimento di Matematica e Applicazioni, Università degli Studi di Milano-Bicocca, ^afrancesco.caravenna@unimib.it*

³*Department of Mathematics, University of Warwick, ^cN.Zygouras@warwick.ac.uk*

The critical $2d$ stochastic heat flow (SHF) is a stochastic process of random measures on $\mathbb{R}^2$, recently constructed in (*Invent. Math.* **233** (2023) 325–460). We show that this process falls outside the class of Gaussian multiplicative chaos (GMC), in the sense that it cannot be realised as the exponential of a (generalised) Gaussian field. We achieve this by deriving strict lower bounds on the moments of the SHF that are of independent interest.

PARTICLE DENSITY IN DIFFUSION-LIMITED ANNIHILATING SYSTEMS

BY TOBIAS JOHNSON^{1,a}, MATTHEW JUNGE^{2,b}, HANBAEK LYU^{3,c} AND
DAVID SIVAKOFF^{4,d}

Place an A -particle at each site of a graph independently with probability p , and otherwise place a B -particle. A - and B -particles perform independent continuous time random walks at rates λ_A and λ_B , respectively, and annihilate upon colliding with a particle of opposite type. Bramson and Lebowitz studied the setting $\lambda_A = \lambda_B$ in the early 1990s. Despite recent progress, many basic questions remain unanswered when $\lambda_A \neq \lambda_B$. For the critical case $p = 1/2$ on low-dimensional integer lattices, we give a lower bound on the expected number of particles at the origin that matches physicists' predictions. For the process with $\lambda_B = 0$ on the integers and on the bidirected regular tree, we give sharp upper and lower bounds for the expected total occupation time of the root at and approaching criticality.

SCALING LIMIT OF THE FLEMING–VIOT MULTICOLOR PROCESS

BY OLIVER TOUGH^a

Department of Mathematics, University of Bath, ^aoki24@bath.ac.uk

We consider the N -particle Fleming–Viot process associated to a normally reflected diffusion with soft catalyst killing. The Fleming–Viot multicolor process is obtained by attaching genetic information to the particles in the Fleming–Viot process. We establish that, after rescaling time by $t \mapsto Nt$, this genetic information converges to the (very different) Fleming–Viot process from population genetics, as $N \rightarrow \infty$. An extension is provided to dynamics given by Brownian motion with hard catalyst killing at the boundary of its domain.

A Basic Course in Measure and Probability: Theory for Applications

Ross Leadbetter, Stamatis Cambanis, and
Vlasos Pipiras

Originating from the authors' own graduate course at the University of North Carolina, this material has been thoroughly tried and tested over many years, making the book perfect for a two-term course or for self-study. It provides a concise introduction that covers all of the measure theory and probability most useful for statisticians, including Lebesgue integration, limit theorems in probability, martingales, and some theory of stochastic processes. Readers can test their understanding of the material through the 300 exercises provided.

The book is especially useful for graduate students in statistics and related fields of application (biostatistics, econometrics, finance, meteorology, machine learning, and so on) who want to shore up their mathematical foundation. The authors establish common ground for students of varied interests which will serve as a firm 'take-off point' for them as they specialize in areas that exploit mathematical machinery.
